IOWA

IIHR-Hydroscience & Engineering

30,000 – 10,500 years

Landform Regions of Iowa

Wetland: 20% of Iowa, 7.6 million acres, <1% remains

Prairie: 70%, 0.1% Remains

Oak Savannah: ~5%, < 1% remains

Pre-European Settlement Streams

Breaking the prairie

Hydrological Modification: 1860s-1910s

How the landscape used to hold water

Attachment 1. Photo of ponded water in drained wetlands of Iowa's Prairie Pothole Region after a heavy rain temporarily backed up the drain tile in early May, 2005. Photo courtesy of Guy Zenner, Iowa DNR Waterfowl Biologist.

In the early 1800s, Iowa contained about 10 to 15 million ha of wetlands. About 99% of that acreage is gone.

Hydrology of Drained (tiled) Wetlands

Tiling field now

Modified Streams

Transformation of Iowa Farms

Figure 19. Cover map of the Winnebago pheasant study area, 1941.

1941

Figure 23. Cover map of the Winnebago pheasant study area, 1976.

1976

Transformation required Simplification

- Many crops to two crops
- Plant-based energy to fossil fuel energy
 - Animals to tractors and other machinery, 80% had a tractor by 1950
- Organic Fertilizers to Inorganic Fertilizers (Post WWII)
- Many farmers (230,000 in 1951) to Fewer farmers (85,000 today)
- Livestock on almost all farms to livestock on only a few
 - 1980: 65,000 farmers raising 13 million hogs
 - Now: 5,000 farmers raising 25 million hogs
- GMO Crops
 - Roundup Ready Soybeans and Corn (87% of soy RR by 2005)
 - Bt Corn (82% of US Corn Crop)

Role of Soybeans

8000 CAFOs

Problem of Scale

- 70% of land in corn-soy rotation
- 11,000 square miles used for ethanol production
- 25 million hogs
- 4 million beef cattle
- 80 million laying chickens
- 5 million turkeys
- 4 million broiler chickens
- 220,000 dairy cows

Water Quality Consequences

Soil loss is still very high

Source:
EWG

Average Soil Erosion (tons/acre)

Nutrients

Nitrogen: Applied as anhydrous ammonia, urea, UAN, manure, MAP and NAP.

Converted to nitrate in the soil profile, mediated by bacteria

Roughly 40% applied in fall, 60% in spring

Especially important in marine ecosystems

VERY WATER SOLUBLE

Loss through tile systems and leaching to groundwater

Nitrate: NO_3^-

Regulated drinking water
contaminant since 1974

Limit: 10 ppm (as N)

Drinking Water

7000 private wells have tested above the safe drinking water level of 10 mg/L since 2000

1/3 of Iowa's Public Water Supplies are vulnerable to nitrate contamination

60 PWSs are removing nitrate

25% of Iowa drink water that has been treated for nitrate reduction

Iowa Nutrient Reduction Strategy

The Iowa Nutrient Reduction Strategy is a science and technology-based framework to assess and reduce nutrients to Iowa waters and the Gulf of Mexico. It is designed to direct efforts to reduce nutrients in surface water from both point and nonpoint sources in a scientific, reasonable and cost effective manner.

The Mississippi River/Gulf of Mexico Watershed Nutrient Task Force was established in 1997 to coordinate activities to reduce the size, severity and duration of hypoxia in the Gulf. Hypoxia is a large area of low oxygen that can't sustain marine life. Nutrients that lead to algae growth are the main culprit.

In its 2008 Action Plan, the task force called upon each of the 12 states along the Mississippi River to develop its own nutrient reduction strategy.

Working together, the Iowa Department of Agriculture and Land Stewardship, the Iowa Department of Natural Resources, and the Iowa State University College of Agriculture and Life Sciences developed this proposed strategy.

The Iowa Nutrient Reduction Strategy was developed by:

Buffer

Iowa Contributions

Missouri Basin: Nitrogen

3.3% of the land
12% of the water
55% of the nitrate

Upper Mississippi: Nitrogen

21% of the land
21% of the water
45% of the nitrate

Mississippi-Atchafalaya: Nitrogen

4.5% of the land
5.9% of the water
29% of the nitrate

How Much Nitrogen Leaves Iowa?

RESEARCH ARTICLE

Iowa stream nitrate and the Gulf of Mexico

Nitrogen Change since 1999

N Category	% change
River	83
Chicken	76
Turkey	59
Hogs	59
Surplus	51
Fixation	41
total inputs	36
Commercial	34
Grain N	27
Beef	10
Dairy	-11

Phosphorus

Applied as MAP, DAP, Super Triple Phosphate and manure.

Not a regulated drinking water contaminant

Attaches tenaciously to soil particles

Loss through erosion primarily

Especially important in freshwater ecosystems.

Phosphorus

Iowa contributes 15% of Phosphorus Load to Gulf of Mexico
(4.5% of Area)

“P concentrations in Iowa streams are likely 2–3 times higher than Illinois streams on average”

“P loads 43% higher in 2017 than in 2004”

Research papers

Total phosphorus export from Iowa agricultural watersheds: Quantifying the scope and scale of a regional condition

Economics of N loss

Cost of Nitrogen: today about \$0.86/lb

Cost to remove nitrogen using BMPs: \$2–\$10/pound

Average statewide load: 600 million lbs

45% reduction = 270 million lbs/year

\$540M to \$2.7B/year

New Tile

Watershed	2002	2007	2016
Middle Cedar	\$1,900,000	\$5,100,000	\$5,600,000
Upper Wapsi	\$1,800,000	\$2,200,000	\$6,600,000
English River	\$187,000	\$492,000	\$1,124,000
North Raccoon	\$536,000	\$936,000	\$1,175,000
Upper Iowa	\$106,000	\$231,000	\$931,000
Clear Creek	\$9,350	\$4,300	\$50,500

Table 1: Estimated amount spent on new drainage tile in six Iowa watersheds.

Landform	% of Iowa's Area	\$/year spent on new tile
Iowan Surface	16.9	\$24,500,000
Des Moines Lobe	21.4	\$5,845,000
Northwest Iowa Plains	8.3	\$2,272,545
Paleozoic Plateau	4.6	\$3,580,862
Southern Iowa Drift Plain	41.3	\$33,837,580
Total	92.5	\$70,064,878

Table 2: Estimated amounts spent in 2016 on new drainage tile in five of Iowa's landforms.

Climate Change

More N loss: Middle Cedar Example

Iowa's Middle Cedar Watershed (credit: Middle Cedar Watershed Management Authority and Iowa DNR)

1200 miles new tile per year

1 acre of pattern tile = 1452' (0.275 mi)

1200 miles = 4364 acres

2018 N loss = 31.5 lbs/ac

New tile multiply N loss by 1.5 (15.9 lbs)

Increase watershed N load by 69,000 lbs

- 136 woodchip bioreactors (we currently have about 50 statewide), or,
- 3 constructed wetlands (currently we have about 100 statewide), or
- Around 7000 new acres of cover crops (currently we have million ac statewide).

How Do You Overcome Structural Drivers to Bad Water Quality?

More Diverse Farming Systems

Marsden Long Term Rotation Study- ISU

Matt Liebman

Corn/Soybean/Oat/Alfalfa/Alfalfa vs Corn/Soybean

N fertilizer use 91% lower

Herbicide use 97% lower

Weed biomass similar

Soybean sudden death syndrome much lower

Soil health is better

Tile nitrate 57% lower

Soil erosion 50% lower

Fossil Fuel use 60% lower

Net returns similar (revenue lower but input costs also lower)

What has happened to Iowa Ag since 1970?

Loss of Crop Diversity

Concentration of Livestock

Decouple Livestock and Crop
Production

Huge increase in Hogs and Chickens

Loss of Cattle—especially on pasture

Fewer Farmers farming more land

Regulations?

1. Ban cropping in the 2-year Flood Plain
2. Ban fall tillage
3. Ban manure on snow and frozen ground
4. Make farmers adhere to ISU fertilization guidelines
5. Reformulate CAFO Regulations
